## 107 【指数関数】

$$y = 9^x + 9^{-x} - 3^{1+x} - 3^{1-x} + 1$$
 の最小値と、そのときの  $x$  の値を求めよ.

$$= 9^{x} + 9^{-x} - 3(3^{x} + 3^{-x}) + 1$$

$$= 9^{x} + 9^{-x} - 3(3^{x} + 3^{-x}) + 1$$

$$\frac{3^{1/4} + 3^{-1/4}}{2} \ge \sqrt{3^{1/4} + 3^{-1/4}} = (3^{1/4} + 3^{-1/4})$$

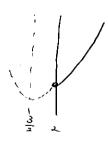

$$\frac{3^{1/4} + 3^{-1/4}}{2} \ge \sqrt{3^{1/4} + 3^{-1/4}} = (3^{1/4} + 3^{1/4} + 3^{-1/4})$$

$$1 \le 2$$

$$q^{x} + q^{-x} = \pm^{2} - 2$$
.

$$= \frac{1^{2} - 3t - 1}{5} \qquad (t \ge 2)$$

$$= \left(t - \frac{3}{2}\right)^{2} - \frac{13}{4}$$

$$t = 2 \text{ art.}$$
 $3^{x_{+}} 3^{-x} = 2.$
